# Flow behind a cylinder

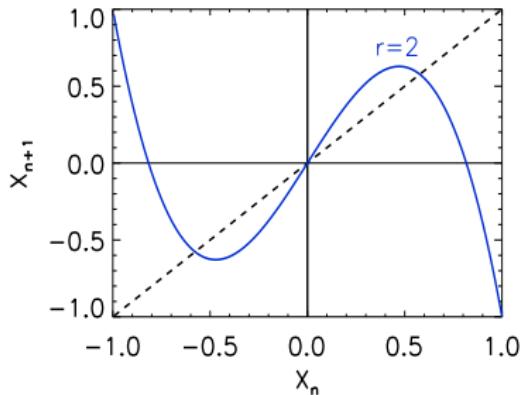

# A deterministic map

$$\mathbf{X}_{n+1} = \mathbf{X}_n [r - (r + 1)\mathbf{X}_n^2]$$

# Properties

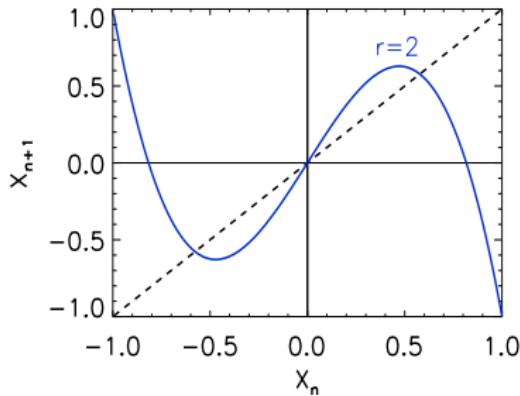

$$\mathbf{X}_{n+1} = \mathbf{X}_n [r - (r + 1)\mathbf{X}_n^2]$$

- It has  $X \rightarrow -X$  symmetry
  - if  $\mathbf{X} = [X_0, X_1, X_2, \dots]$  is a solution
  - then  $\mathbf{X}' = [-X_0, -X_1, -X_2, \dots]$  is a solution

# Properties

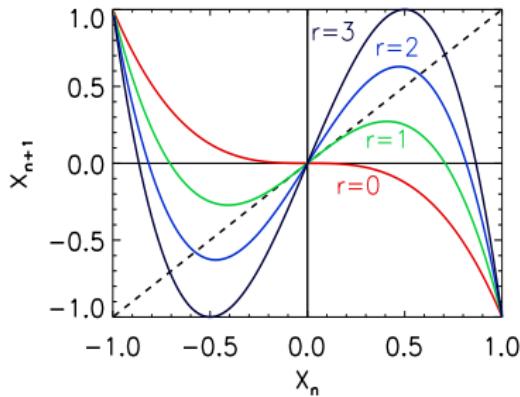

$$\mathbf{X}_{n+1} = \mathbf{X}_n [r - (r + 1)\mathbf{X}_n^2]$$

- It has  $X \rightarrow -X$  symmetry
- $\mathbf{X} = \mathbf{0}$  is always a solution
- $\mathbf{X} = [+1, -1, +1, -1, +1, -1, \dots]$  is also a solution

# Properties

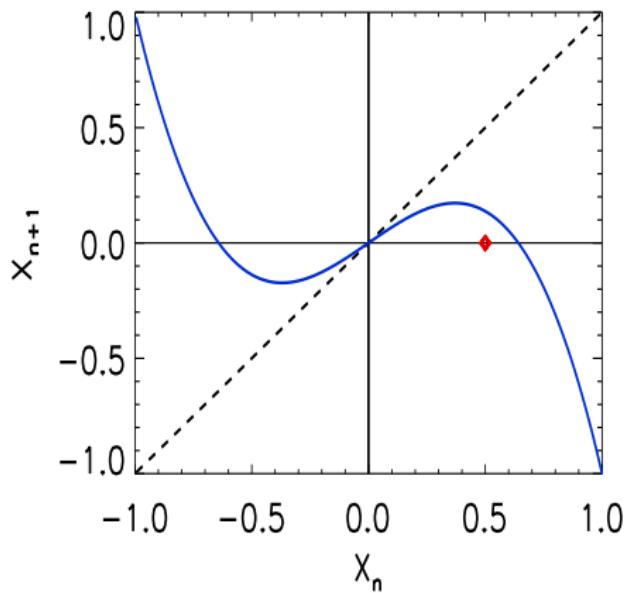

$$\mathbf{X}_{n+1} = \mathbf{X}_n [r - (r + 1)\mathbf{X}_n^2]$$

- It has  $X \rightarrow -X$  symmetry
- $\mathbf{X} = \mathbf{0}$  is always a solution
- $\mathbf{X} = [+1, -1, +1, -1, +1, -1, \dots]$  is also a solution
- Maps  $[-1, 1] \rightarrow [-1, 1]$  for  $0 \leq r \leq 3$

# The $r=3$ case

$$\mathbf{X}_{n+1} = \mathbf{X}_n(r - (1 + r)\mathbf{X}_n^2)$$

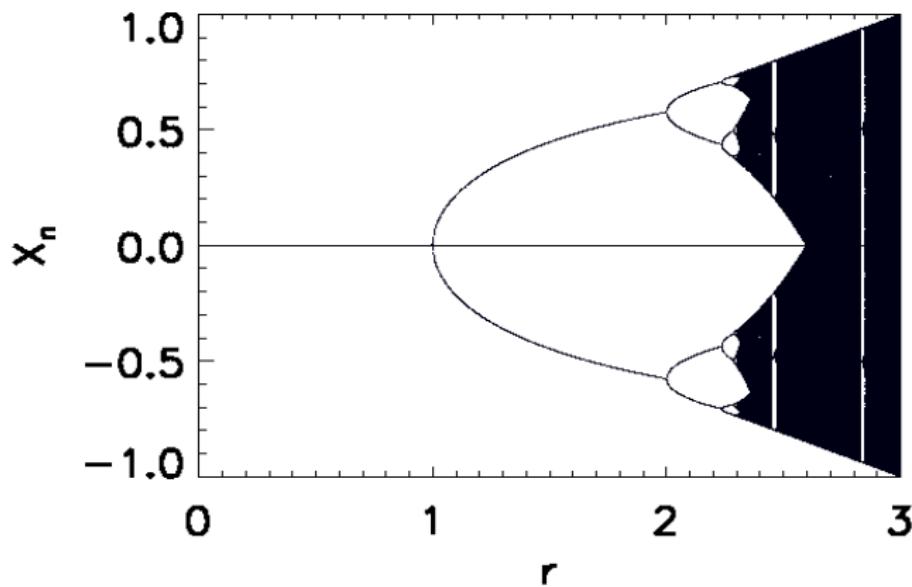

- The map changes sign at  $Z = \sqrt{r/(1+r)}$
- Local maximum at:  $dX_{n+1}/dX_n = 0$  at  $Y = \sqrt{r/3(r+1)}$
- Maximum value  $W = Y(r - (r+1)Y^2) = \sqrt{2r^3/27(r+1)}$

The transition to the symmetric behavior comes when  
 $W(r) > Z(r)$  where

$$r > \frac{\sqrt{27}}{2}$$

## The r=3 case

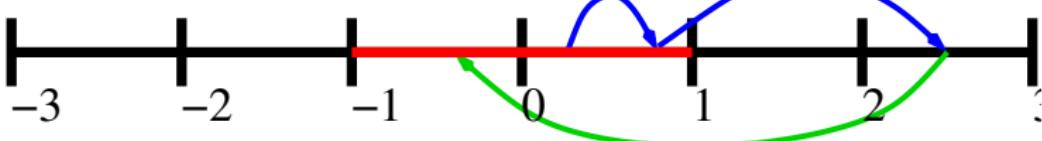

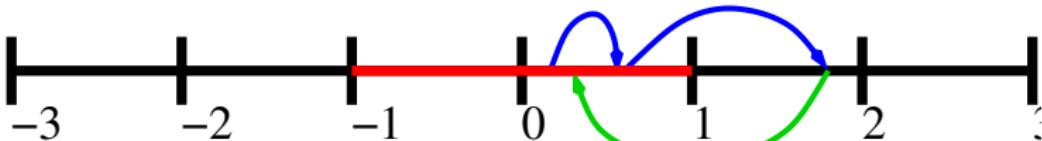

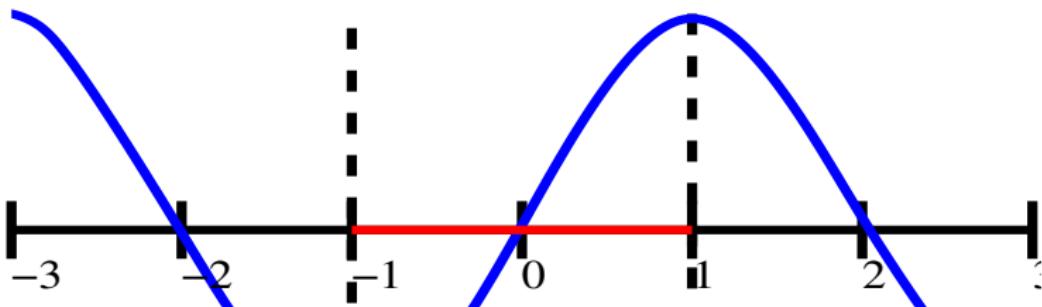

$$\mathbf{X}_{n+1} = 3\mathbf{X}_n - 4\mathbf{X}_n^3$$

A change of variables:  $X_n = \sin(\pi\theta_n/2)$

$$\begin{aligned}\sin\left(\frac{\pi\theta_{n+1}}{2}\right) &= 3\sin\left(\frac{\pi\theta_n}{2}\right) - 4\sin^3\left(\frac{\pi\theta_n}{2}\right) \\ &= \sin\left(3\frac{\pi\theta_n}{2}\right)\end{aligned}$$

$$\theta_{n+1} = 3\theta_n$$

$$\theta_n \rightarrow 3\theta_n$$

# Probability Distribution function

$P_X(X)dX$  = Probability of  $X_n \in [X, X + dX]$

$P_\theta(\theta)d\theta$  = Probability of  $\theta_n \in [\theta, \theta + d\theta_n]$

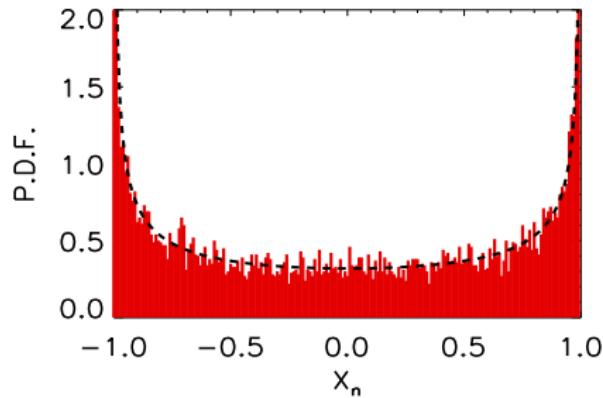

$$P_\theta(\theta)d\theta = P_X(X)dX$$

$$P_\theta(\theta) = 1/2$$

$$\begin{aligned} P_X &= \left( \frac{dX}{d\theta} \right)^{-1} P_\theta \\ &= \left( \frac{\pi}{2} \cos(\pi\theta/2) \right)^{-1} P_\theta \end{aligned}$$

$$P_X(X) = \frac{2}{\pi\sqrt{1-X^2}}$$

# Probability Distribution function

PDF respects the  $X \rightarrow -X$  symmetry!

# Statistical Recovery of Symmetries

We will say that a field  $\mathbf{u}(\mathbf{x}, t)$  is statistically invariant under a transformation  $\mathcal{T}$  or that it has a statistical  $\mathcal{T}$ -symmetry if:

eg

$$P(\mathcal{T}[\mathbf{u}]) = P(\mathbf{u})$$

$$P[\mathbf{u}(\mathbf{x}, t)] = P[\mathbf{u}(\mathbf{x} + \ell, t)]$$

## Some key points

- At very small  $r$ , ( $Re$ ) symmetric solutions are observed
- When  $r$ , ( $Re$ ) is increased symmetries are broken: ie observed individual solutions do not satisfy them
- Symmetric solutions still exist but are unstable
- Symmetries are recovered in a statistical sense
- Individual solution convey little information
- The system needs to be described in a statistical way:  $P(\mathbf{u})$
